

Guannan Liang

Contact Information	guannan.liang@uconn.edu 87 Ruby Rd Apt 23, Willington, CT 06279 860-931-4307
Research Interests	Machine Learning; Mathematical Optimization; Statistics; Deep Learning; Recommender System.
Education	<p>University of Connecticut, Storrs, CT <i>January 2016 ~ Present</i> Ph.D. in Machine Learning, Department of Computer Science and Engineering <i>Advisor: Jinbo Bi</i></p> <p>University of California, Davis, CA <i>September 2014 ~ December 2015</i> M.S.in Statistics, Department of Statistics</p> <p>Zhengzhou University, Zhengzhou, PRC <i>September 2009 ~ June 2013</i> B.S. in Mathematics, School of Mathematics and Statistics</p>
Employment	<p>Research Intern at Rakuten USA, CA <i>September 2020 ~ December 2020</i></p> <ul style="list-style-type: none">• Focus on developing new recommender system with cold start item.• Explore shared network structure and different attention mechanisms to improve the performance of item cold start recommender system. <p>Research Assistant at Laboratory of Machine Learning & Health Informatics, UCONN <i>January 2016 ~ Present</i></p> <ul style="list-style-type: none">• Develop new machine learning algorithms, such as for sparse learning problem, optimizers for deep learning applications, differential private (DP) algorithms and federated learning algorithms.• Collaborate across labs to identify new composite traits for alcohol dependence. <p>Graduate Assistant at Eversource Energy Center, UCONN <i>May 2017 ~ Present</i></p> <ul style="list-style-type: none">• Implemented weather forecasting (WRF 3.7, WRF 3.8 and ICLAMS systems) , Flooding forecasting (CREST system) and machine learning models for power outage predictions for Eversource Energy (CT, MA, NH areas) and The United Illuminating Company (UI) on the HPC resources at UConn.• Proposed new machine learning and deep learning methods to improve the performance of existing operational system, such as LSTM model to capture the sequence information in weather.
Projects	<p>Effective algorithms for non-convex non-smooth regularized learning problems</p> <ul style="list-style-type: none">• Proposed a group of stochastic proximal gradient methods based on arbitrary sampling to solve a family of non-convex non-smooth regularized empirical risk minimization problems.• Presented a new analytic approach to investigate the convergence and computational complexity of the proposed methods, which helps compare the different sampling schemes.

Faster algorithm for nonconvex sparse learning problems

- Proposed a hard thresholding method based on stochastically controlled stochastic gradients (SCSG-HT) to solve a family of sparsity-constrained empirical risk minimization problems.
- Proved that the new method has a strong guarantee to recover the optimal sparse estimator and its computational complexity is independent of sample size n , which enhances the scalability.

Effective ADAM-type optimizers to speed up (Federated) Deep Learning training process

- Designed a new (Fed) ADAM-typed method by calibrating the A-LR with a softplus function.
- Conducted experiments to show that the proposed methods outperform existing (Fed)ADAM-typed methods and generalize even better than S-Momentum in multiple deep learning tasks.

Matrix completion problem with application in recommender system

- Proposed a new algorithm which utilize side information to improve existing matrix completion methods.
- Designed experiments show that our new proposed approach outperforms three state-of-the-art methods both in simulations and on real world datasets.

Multi-party differential private machine learning algorithms with privacy guarantees

- Developed differentially private decentralized ADMM algorithms.
- Designed stochastic differentially private hard thresholding algorithms for non-convex sparse learning problems.
